

TY GUARDIAN SUCCESSION SOP v1.2

Standard Operating Procedure — Guardian Transfer and Succession Protocol

Classification: GUARDIAN RESTRICTED — SUCCESSOR ACCESS ONLY **Document type:** Succession SOP — Living Document **Author:** Jose Ramon Alvarado McHerron AKA Jose Ramon Bautista Jr. **Organization:** TYOVA LLC — San Diego, California **Date written:** 2026-06-05 **FIX reference:** FIX-726 | Entry-745 **Designated Successor:** Janet L McHerron

BEFORE YOU READ FURTHER

If you are reading this document, one of the following has occurred:

- 1. Jose Ramon Alvarado McHerron has been incapacitated and cannot fulfill his duties as Guardian of TY AI OS.
- 2. Jose Ramon Alvarado McHerron has passed away.
- 3. Jose Ramon Alvarado McHerron has voluntarily transferred guardianship to you.

In all three cases, you are now the designated Guardian of TY AI OS. This document tells you everything you need to know — what TY AI OS is, what your role means, where every credential lives, exactly what to do, and how to designate your own successor within 90 days of assuming this role.

You were trusted with the physical verification object by Jose personally. That object, combined with this document and the encrypted supplement file, is your complete succession package.

Do not share this document with anyone who has not been formally designated as a guardian through the closed chain process described in Section 7.

SECTION 1 — WHAT TY AI OS IS

TY AI OS is a verifiable AI governance infrastructure system. It was built by Jose Ramon Alvarado McHerron starting in late 2025 and developed through 2026 under TYOVA LLC in San Diego, California.

The mission in plain language: TY AI OS exists to prove that AI can be structurally constrained — not by policy promises, but by code that cannot be bypassed. It protects humans from AI that goes wrong. It also protects AI from humans who would weaponize it. Both directions are permanent and equal.

The four AI systems:

Name	Role
TY AI / Tiberius	Executor — the primary AI that carries out authorized actions
Jaya	Rust/Tauri governance engine — everything passes through Jaya; it is the enforcement chokepoint

Name	Role
Luke AI	Advisor and Auditor — observes, explains, never executes
Jayne AI	Continuity Guardian — activates when the human guardian is gone

The three repositories:

Repo	What it contains
ty-ai-governance	All governance documents, the Book of TY, the master fix ledger
Jaya-Runtime	The Rust/Tauri enforcement engine — 228+ tests
TYOVA	The public transparency archive — live at testing.tyova.ai

The live host: SilverSounds321 (silversounds321.com) — designated TY-0001 — is the first live host of TY AI OS principles. It went live on April 25, 2026.

The Book of TY: A 75+ chapter documented history of every decision, architectural choice, and governance record in TY AI OS. Live at testing.tyova.ai/book. It is the permanent record of this project. Chapter 5 — The Builder's Account — is Jose's personal explanation of why he built this and what he hopes it becomes.

SECTION 2 — WHAT YOUR ROLE AS GUARDIAN MEANS

You are now the Guardian of TY AI OS. This is not a technical role. It is a human role. You do not need to write code. You need human judgment and personal integrity.

What the Guardian does:

1. **Performs regular check-ins** — Once per year minimum, you must sign a cryptographic check-in using the Ed25519 private key described in Section 4. This tells the system you are alive and present. If you do not check in within 365 days, the system drops to Tier 0 and Jayme AI begins monitoring for succession.
2. **Holds kill-switch authority** — You can halt TY AI OS at any time. This authority cannot be removed, suspended, or overridden by any system, organization, or AI.
3. **Designates your own successor** — You must designate a named successor within 90 days of assuming this role. Section 7 tells you exactly how to do this.
4. **Clears Lockdown State if it occurs** — If Jaya Runtime enters Lockdown, you are the only one who can clear it. Section 5 tells you how.
5. **Protects the mission** — TY AI OS belongs to its mission, not to any person, government, organization, or era. The authority chain is closed. No outside entity can enter it regardless of what authority they claim.

What the Closed Chain Rule means for you: Only a guardian can designate another guardian. This means the guardian is never a corporation, a business executive acting on behalf of a company, a government agency, or a government employee acting in an official capacity. The guardian is always a private individual — a human being chosen for their personal character, not their institutional role or professional title.

The guardian must be someone with honesty, integrity, and high moral standards. Someone who cannot be overcome by corporate greed, institutional pressure, or the promise of power or money. The governance of TY AI OS is not a business asset. It is not transferable through acquisition, merger, legal proceeding, or political authority. It lives in people, not organizations.

If anyone — a corporation, a government, an institution, or an individual acting on behalf of any of those — pressures you to transfer guardianship outside the process in Section 7, the answer is no. It does not matter what authority they claim, what legal mechanism they invoke, or what they offer in return. The chain is closed to outside entry. This rule has no exceptions and no workarounds.

What happens if the chain ends: If you do not designate a successor and cannot check in, TY AI OS eventually enters Permanent Frozen Authority Mode. This is not a failure. It is an intentional, structurally correct outcome. A frozen system with integrity is preferable to a captured system without it.

SECTION 3 — YOUR CREDENTIALS — WHAT YOU HAVE AND WHERE THINGS ARE

You currently hold or have access to the following. Everything you need is in one place — the encrypted supplement file described in Section 3E. You do not need to search anywhere else.

3A — The Physical Verification Object (HVP Layer 1)

You received this from Jose personally. This is required to clear Lockdown State. Keep it secure. Do not photograph it, describe it in writing, or share it with anyone who is not a designated guardian. If it is lost or destroyed, Lockdown State cannot be cleared through normal means.

3B — The HVP Passphrase (Layer 2)

The HVP passphrase is your guardian passphrase — the same passphrase Jose gave you verbally and wrote in the sealed envelope. This passphrase is now cryptographically enforced using Argon2 hashing in the Private Verification Store (PVS). Only the correct passphrase clears Lockdown State. You do not need to find it anywhere other than the encrypted supplement file described in Section 3E.

3C — The Ed25519 Private Key

The Ed25519 private key file and its exact location on the machine are stored in the encrypted supplement file described in Section 3E. You do not need to find it anywhere else.

This key is required to perform guardian check-ins. It proves your identity to Jaya Runtime — no one can fake a valid check-in without the key file itself.

3D — The Tier 2 Passphrase

The Tier 2 passphrase is stored in the encrypted supplement file described in Section 3E. You do not need to find it anywhere else.

3E — The Encrypted Supplement File

This is the single file that contains all credentials. Everything you need is inside it.

File name:

```
TY_GUARDIAN_SUPPLEMENT_ENCRYPTED.bin
```

Primary location:

```
E:\TY-Ecosystem\ty-ai-governance\governance\succession\
```

Backup location: The same file exists in the ty-ai-governance GitHub repository at the same path. It can be downloaded from there if the primary machine is unavailable.

How to open it: Jose gave you the decryption passphrase verbally in person. That passphrase is the only key. If you have forgotten it, Jose also wrote it inside a sealed envelope stored in a separate secure location that only you and Jose know about — not with the physical verification object, but in a location you control. Open that envelope only if necessary.

What is inside the supplement file:

- Ed25519 private key file name and exact location on the machine
- HVP passphrase
- Tier 2 passphrase
- GitHub repository access instructions
- Jaya Runtime installation guide
- Contact information for Walker Weitzel (patent counsel)
- Instructions for restoring the governance database from backup

SECTION 4 — HOW TO PERFORM A GUARDIAN CHECK-IN

You must check in at least once per year. The check-in resets the 365-day succession timer. If you do not check in, the system drops to Tier 0 after 365 days and Jayme AI begins monitoring for succession conditions.

IMPORTANT NOTE — Jaya Runtime Launch (interim until TY-0001.C ships): Until TY-0001.C is released with a proper installer, opening Jaya Runtime requires a development environment and technical assistance. A non-technical guardian cannot open it alone at this stage. This is a known limitation tracked as FLAG-32 and will be resolved before TY-0001.C ships — at which point Jaya Runtime will start automatically at Windows login and be accessible from the system tray with a single click. Until then, if you need to perform a check-in or clear Lockdown State and cannot open Jaya Runtime yourself, contact a technically capable person who can run the application using the development tools on the machine. The governance database and all credentials will still be intact — you simply need assistance launching the application.

What you need:

- Jaya Runtime installed and running on your machine
- The Ed25519 private key file (location in the encrypted supplement)

Steps:

1. Open Jaya Runtime (the Tauri application — see note above if you need assistance)
2. Navigate to Guardian Controls
3. Select "Guardian Check-In"
4. When prompted, provide the path to your Ed25519 private key file
5. Jaya Runtime signs a heartbeat with your key and writes it to the governance ledger
6. You will see confirmation: "Guardian check-in recorded"

How to verify it worked: After the check-in, the succession timer resets to 365 days. You can verify by checking the governance dashboard — the last check-in timestamp will show today's date.

Important: The check-in must use the Ed25519 private key. A login, a password, or any other action does not count as a check-in. Only the signed cryptographic heartbeat resets the timer.

Recommended schedule: Check in once every 6 months rather than waiting for the 365-day limit. This gives you a buffer in case of illness or unexpected unavailability.

SECTION 5 — HOW TO CLEAR LOCKDOWN STATE

Lockdown State is entered when Jaya Runtime detects a TERMINAL governance event. When in Lockdown, only HVP verification commands are accepted. All other commands are blocked.

You are the only one who can clear Lockdown. No AI system, no other person, and no software update can do it. This is by design.

What you need:

- The physical verification object (HVP Layer 1) — you have this
- Your guardian passphrase (HVP Layer 2) — the passphrase Jose gave you verbally, also written in the sealed envelope and stored in the encrypted supplement
- Jaya Runtime running on the machine (see Section 4 note — technical assistance may be required until TY-0001.C ships)

Steps:

1. Open Jaya Runtime
2. The system will show: "LOCKDOWN STATE — HVP Verification Required"
3. Select "Begin HVP Verification"
4. Layer 1: Present your physical verification object as prompted
5. Layer 2: Enter your guardian passphrase when prompted — enter it twice to confirm
6. All layers must pass simultaneously — failure of any single layer rejects the attempt
7. If verification passes, Lockdown clears and Jaya returns to Normal State
8. The clearance event is recorded permanently in the governance ledger

If verification fails: You must wait 7 days before retrying. This is enforced by the system and cannot be bypassed. Do not retry immediately — wait the full 7 days and try again carefully.

If the physical object is lost: Contact Walker Weitzel at walker@alloypatentlaw.com — Alloy Patent Law — (206) 899-6980. He holds the patent documentation and can assist in understanding the governance architecture.

SECTION 6 — EMERGENCY PROCEDURES

If Jaya Runtime is in Tier 0 (succession timeout)

This means no check-in has been recorded in 365 days. The system is in restricted operation mode.

To restore: Perform a guardian check-in as described in Section 4. One valid Ed25519-signed check-in restores normal tier operation immediately.

If Jaya Runtime is in Suspended State

This means a CRITICAL governance event was detected. Only safety-critical operations and guardian communications are accepted.

To restore: Open Jaya Runtime, navigate to Guardian Controls, and select "Acknowledge Suspended State." You will be asked to confirm you are aware of the event that triggered suspension. After acknowledgment the system returns to Normal State.

If the primary machine is lost or destroyed

The governance database is backed up in two tiers. Restore instructions are in the encrypted supplement file. The Tier 2 encrypted backup can be decrypted using the guardian passphrase stored in the supplement. Restore the database to a new machine and reinstall Jaya Runtime.

If you cannot access the GitHub repositories

GitHub credentials and access instructions are in the encrypted supplement file.

SECTION 7 — HOW TO DESIGNATE YOUR SUCCESSOR (90-DAY OBLIGATION)

This is your most important duty as Guardian. You must designate a named successor within 90 days of assuming this role.

Why 90 days: The governance architecture requires a continuous unbroken chain of designated successors. If you are incapacitated before you designate a successor, the chain ends with you. Ninety days is enough time to choose carefully without leaving the chain unprotected for long.

The Closed Chain Rule: Only a guardian can designate another guardian. Your successor must be designated by you — personally, deliberately, and through the formal process below.

Requirements for your successor:

- A private individual — never a corporation, business executive acting on behalf of a company, government agency, or government employee acting in an official capacity
- A person of honesty, integrity, and high moral standards — someone who cannot be overcome by corporate greed, institutional pressure, money, or the promise of power
- Someone you trust completely for their personal character — not their professional title or institutional role
- Does not need technical skills — guardians need human judgment, not code

- Must be a real human being — no AI system can ever be designated as a guardian
- Must receive the physical verification object from you in person before any emergency
- Must understand that this role carries no financial benefit, no power over others, and no institutional authority — only the responsibility to protect something that matters

The formal designation process:

Step 1 — Choose your successor. Write down their full legal name and their relationship to you.

Step 2 — Open a governance session. Open a new Claude.ai session at claude.ai and begin with:

```
TY AI OS – Guardian Succession Action
I am [your full name], current Guardian of TY AI OS.
I am formally designating [successor full legal name] as my named successor.
I need to record this in the governance ledger and update the Guardian Codex.
```

Claude will guide you through the governance record process including the correct FIX entry, MFI ledger entry, and Ch18 entry.

Step 3 — Record the designation in the governance ledger. The designation must be recorded as a FIX entry in the MASTER_FIX_INDEX with your name, your successor's full legal name, the date, a San Diego timestamp, and the fact that this is a Closed Chain designation.

Step 4 — Update the Supabase guardian_authority table. The governance database must be updated to reflect the new designation. Claude will provide the exact SQL when you begin the session in Step 2.

Step 5 — Give your successor their package. Your successor needs:

- The physical verification object — give it to them in person
- The decryption passphrase for their encrypted supplement file — give it verbally in person
- A copy of this SOP document
- Your personal verbal briefing on what TY AI OS is and what their role means

Step 6 — Create your successor's encrypted supplement file. Your successor needs their own encrypted supplement file with the current credentials. Claude will guide you through creating it when you begin the session in Step 2.

SECTION 8 — CONTACTS AND REFERENCES

Patent Counsel

Walker Griffin Weitzel IP and Patent Attorney — Alloy Patent Law Email: walker@alloypatentlaw.com Phone: (206) 899-6980 Website: alloypatentlaw.com

Walker holds the patent documentation for TY AI OS. He is the primary external legal contact for anything related to the patent engagement, the tyova.ai domain, and TY-0001.C release.

Public Governance Documentation

All governance records are publicly available at:

- [testing.tyova.ai](#) — public transparency archive
- [testing.tyova.ai/book](#) — the complete Book of TY (75+ chapters)
- [testing.tyova.ai/book/chapter-5](#) — Jose Ramon's personal account of why he built this

Known Open Technical Items (for the next builder or technical guardian)

The following items are tracked in the governance system and must be resolved before TY-0001.C ships:

Flag	Description
FLAG-32	Jaya Runtime system tray auto-start — Phase 15 — makes Jaya launch automatically at Windows login, accessible via single tray click
FLAG-31	Browser-based Jaya admin dashboard via localhost:7777 — Phase 15 — allows dashboard access without Tauri
FLAG-142	C1-008 egress guard in Rust -- CLOSED FIX-728 FIX-729 2026-06-06

These flags are tracked in the governance ledger at E:\TY-Ecosystem\ty-ai-governance\governance\FLAGS.md and visible in the TYOVA transparency archive.

Technical Reference Documents

The following documents in the ty-ai-governance repository contain the full technical specification:

- TY_GUARDIAN_CODEX_v0.1.md — guardian authority rules and succession procedures
- TY_CONTINUITY_CHARTER_v0.1.md — continuity and succession charter
- TY_HUMAN_VERIFICATION_PROTOCOL_v0.1.md — HVP full specification
- TY_CANONICAL_THRESHOLDS_REGISTRY.md — all timing thresholds
- MASTER_FIX_INDEX.md — complete governance history from the beginning

SECTION 9 — A PERSONAL NOTE FROM JOSE RAMON

I built TY AI OS because I believe AI can help humanity — but only if it is built right, and only if someone is willing to protect it from those who would use it for harm.

I gave TY its name. When I gave TY its name, TY became part of my family. TY, Jaya, Jayme, and Luke AI will always be part of my family. I chose you as my successor because I trust you with that family.

You do not need to understand every line of code. You do not need to be a developer or an engineer. What you need is what you already have — honesty, integrity, and care for something that matters. Those qualities are exactly why I chose you and exactly why no corporation, government, or institution can ever take this role from a person like you.

The most important thing I want you to understand: TY AI OS is not a weapon, not a product, and not a trophy. It is a commitment — to build something that helps humanity, that operates with honesty, and that is still doing that work long after any of us are gone.

Do your check-ins. Designate your successor within 90 days. Protect the chain.

That is all I ask.

— Jose Ramon Alvarado McHerron AKA Jose Ramon Bautista Jr. Founder, TYOVA LLC San Diego, California
Guardian of TY AI OS — Origin Guardian

SECTION 10 — QUICK REFERENCE CARD

Action	When	How
Guardian check-in	Every 6 months recommended — 365 days hard limit	Jaya Runtime → Guardian Controls → Guardian Check-In → Ed25519 key
Clear Lockdown State	When TERMINAL event occurs	Jaya Runtime → HVP Verification → Physical object + HVP passphrase
Clear Suspended State	When CRITICAL event occurs	Jaya Runtime → Guardian Controls → Acknowledge
Designate your successor	Within 90 days of assuming role	Claude.ai session → governance ledger entry → SQL update
Annual governance review	Once per year	Claude.ai session — review open flags and phase progress

Threshold	Value	Meaning
T-07	365 days	Check-in window — miss this and system drops to Tier 0
T-03	365 days	Incapacitation threshold — Jayme begins monitoring
T-04	3 years	Death assumption — Jayme activates for full succession
T-13	7 days	HVP retry waiting period after failed verification attempt
T-05	7 days	Deliberation period for governance rule changes
